

CBC Radio: The internet is full of misinformation. That's by design, experts say

May 20, 2025

[Eugina Leung](#), assistant professor of marketing, was interviewed for a [CBC Radio](#) story about the public's vulnerability to online bias, misinformation and manipulation.

In [another study from March](#), Tulane University assistant professor Eugina Leung investigated how results on search engines like Google, Bing and ChatGPT differ depending on the search terms used.

"What we find is that people tend to use search terms that lean toward what they already believe is true," said Leung. "Imagine, we asked

participants to search for health effects of caffeine. If they believe that caffeine is quite likely to be harmful, then they're more likely to come up with search terms like dangers of caffeine, caffeine side effects, caffeine health risks."

These narrow search terms, Leung said, mean that the users are just receiving results that are tied to their beliefs.
