

Scientific Inquirer: Why Searching for Truth Online Might Be Making Us More Biased

June 26, 2025

[Eugina Leung](#), assistant professor of marketing, was interviewed by [Scientific Inquirer](#) about her research finding that search engine users tend to reinforce their own beliefs and biases as a result of the search terms they use.

“Search engines like Google or ChatGPT are engineered to deliver the most relevant results for the specific words you used. So, a search for ‘dangers of caffeine’ will return a list of articles about its negative effects. The algorithm is doing its job perfectly, but the result is a narrow slice of information that matches the bias in your original query.”
